**Q. 51 – Q. 60 carry two marks each.**

- Q.51 Consider a hemispherical glass lens (refractive index is 1.5) having radius of curvature  $R = 12$  cm for the curved surface. An incoming ray, parallel to the optical axis, is incident on the curved surface at a height  $h = 1$  cm above the optical axis, as shown in the figure. The distance  $d$  (from the flat surface of the lens) at which the ray crosses the optical axis is \_\_\_\_\_ cm (Round off to two decimal places).

- Q.52 Twenty non-interacting spin  $\frac{1}{2}$  particles are trapped in a three-dimensional simple harmonic oscillator potential of frequency  $\omega$ . The ground state energy of the system, in units of  $\hbar\omega$ , is \_\_\_\_\_.
- Q.53 A thin film of alcohol is spread over a surface. When light from a tunable source is incident normally, the intensity of reflected light at the detector is maximum for  $\lambda = 640$  nm and minimum for  $\lambda = 512$  nm. Taking the refractive index of alcohol to be 1.36 for both the given wavelengths, the minimum thickness of the film would be \_\_\_\_\_ nm (Round off to two decimal places).
- Q.54 For the Boolean expression  $Y = ABC + \bar{A}\bar{B}C + \bar{A}B\bar{C} + A\bar{B}\bar{C}$ , the number of combinations for which the output  $Y = 1$  is \_\_\_\_\_.

- Q.55 An RC circuit is connected to two dc power supplies, as shown in the figure. With switch  $S$  open, the capacitor is fully charged.  $S$  is then closed at time  $t = 0$ . The voltage across the capacitor at  $t = 2.4$  milliseconds is \_\_\_\_\_ V (Round off to one decimal place).

- Q.56 A current  $I$  is uniformly distributed across a long straight nonmagnetic wire ( $\mu_r = 1$ ) of circular cross-section with radius  $a$ . Two points  $P$  and  $Q$  are at distances  $\frac{a}{3}$  and  $9a$ , respectively, from the axis of the wire. The ratio of the magnetic fields at points  $P$  and  $Q$  is \_\_\_\_\_.
- Q.57 A particle  $A$  of mass  $m$  is moving with a velocity  $v\hat{i}$ , and collides elastically with a particle  $B$ , of mass  $2m$ .  $B$  is initially at rest. After collision,  $A$  moves with a velocity  $v_A\hat{j}$ . If  $v_B$  is the final speed of  $B$ , then  $v_A^2 = kv_B^2$ . The value of  $k$  is \_\_\_\_\_.
- Q.58 In an X-ray diffraction experiment with Cu crystals having lattice parameter  $3.61 \text{ \AA}$ , X-rays of wavelength of  $0.090 \text{ nm}$  are incident on the family of planes  $\{1\ 1\ 0\}$ . The highest order present in the diffraction pattern is \_\_\_\_\_.

- Q.59 A parallel plate capacitor having plate area of  $50 \text{ cm}^2$  and separation of  $0.1 \text{ mm}$  is completely filled with a dielectric (dielectric constant  $K = 10$ ). The capacitor is connected to a  $10 \text{ k}\Omega$  resistance and an alternating voltage  $v = 10 \sin(100\pi t)$ , as shown in the figure. The switch  $S$  is initially open and then closed at  $t = 0$ . The ratio of the displacement current in the capacitor, to the current in the resistance, at time  $t = \frac{2}{\pi}$  seconds is \_\_\_\_\_ (Round off to three decimal places).

- Q.60 The wavelength of characteristic  $K_\alpha$  X-ray photons from Mo (atomic number 42) is \_\_\_\_\_ Å. (Round off to one decimal place).  
(speed of light is  $3 \times 10^8 \text{ m/s}$ ; Rydberg constant  $R = 1.09 \times 10^7/\text{m}$ )
